

Big Y-700 reveals the Y-Tree at unprecedented resolution

The 14th International Conference
on Genetic Genealogy
3/24/19

Caleb F. Davis, Ph.D.
Bioinformatics Scientist

A typical male genome karyotype: chromosomes 1-22 + X & Y

How to build a tree out of the differences (SNPs)

- Start with the DNA letters at each position that differs between a man and any other man.
- Men
 - 1: ATCGAAG
 - 2: AACGAAG
 - 3: ATCGTAG
- What is the most likely family tree given these differences among the three men?
